

Solid-state battery sintering technology principle

What are the fabrication techniques for solid-state batteries (SSBs)?

Other methods, such as plasma technology and atomic layer deposition (ALD), are also being explored as potential fabrication techniques for solid-state batteries owing to their attractive features (Fig. 1). Fig. 1. Schematic diagram of the fabrication techniques for solid state batteries (SSBs) and their features.

How do solid-state batteries work?

The working principle of solid-state batteries (SSBs) is similar to that of conventional liquid electrolyte-based batteries, with the key difference being the use of solid-state electrolytes, as illustrated in Fig. 2 (a & b). These solid electrolytes facilitate the movement of lithium ions from the anode to the cathode.

Can cold sintering be used to recycle battery materials?

In addition to the potential for composite fabrication, cold sintering could enable recycling of spent battery materials. Eliminating the need for high-temperature processing and the use of solvents to decompose materials into recoverable compounds is advantageous.

What are the different sintering techniques?

Several advanced sintering techniques for solid electrolytes include hot pressing, field-assisted sintering, flash sintering, microwave sintering, and spark plasma sintering.

What is a solid-state battery?

Solid-state batteries have the potential for higher energy densities and enhanced safety when compared to conventional lithium-ion batteries. The perovskite-type $\text{Li}_{3-x}\text{La}_{2/3-x}\text{TiO}_3$ (LLTO) is an attractive ceramic electrolyte due to its high ionic conductivity, broad electrochemical stability window, and thermal and chemical stability.

Can solid electrolytes be used in solid-state batteries?

The field of solid electrolytes has seen significant strides due to innovations in materials and fabrication methods. Researchers have been exploring a variety of new materials, including ceramics, polymers, and composites, for their potential in solid-state batteries.
