What are the recent trends in electrode materials for Li-ion batteries?

This mini-review discusses the recent trends in electrode materials for Li-ion batteries. Elemental doping and coatingshave modified many of the commonly used electrode materials, which are used either as anode or cathode materials. This has led to the high diffusivity of Li ions, ionic mobility and conductivity apart from specific capacity.

Why are Li ions a good electrode material?

This has led to the high diffusivity of Li ions, ionic mobility and conductivity apart from specific capacity. Many of the newly reported electrode materials have been found to deliver a better performance, which has been analyzed by many parameters such as cyclic stability, specific capacity, specific energy and charge/discharge rate.

How does lithiation affect energy storage capacity of silicon-based electrodes?

However, short ionic and electric conductivity of silicon-based materials results in huge volume dissimilarity through lithiation/de-lithiation development which can lead to a severe diminishing of energy storage capacity of electrodes ,.

How to develop electrode materials for electrochemical recital of LIBS?

Another option is to develop electrode materials having short diffusion lengths, high mechanical strength, high surface to dimensions ratio in organizing and having fully exposed active surfaces to progress the electrochemical recital of LIBs , , , , .

Can iron disulfide be used as cathode material for non-rechargeable Li-ion batteries?

Iron disulfide (FeS 2) is widely used as cathode material for non-rechargeable Li-ion batteries. In a recent report, biomass-carbon@FeS 2 nanocomposite cathode was synthesized using auricularia auricula by the process of carbonization-sulfuration , in the synthesis process green and renewable auricularia auricula acts as a carbon source.
