What is the Nernst equation for a lithium ion battery?

We have used the Nernst Equation, in the chart above, to capture a lithium ion battery with a 3.7V Standard Potential. Cell Voltage matches Standard Potential when the concentration of  $\text{Li}^+$  in solution matches the concentration of Li intercalated at the anode. Here  $[\text{LiC}_6] = [\text{LiMxOy}]$ . Hence  $[\text{LiMxOy}] / [\text{LiC}_6] = 1$ . Hence  $\ln(1) = 0$ . Hence  $E = E^0$ .

Which principle applies to a lithium-ion battery?

The same principle as in a Daniell cell, where the reactants are higher in energy than the products, applies to a lithium-ion battery; the low molar Gibbs free energy of lithium in the positive electrode means that lithium is more strongly bonded there and thus lower in energy than in the anode.

Where does oxidation take place in a lithium ion battery?

Inside a lithium-ion battery, oxidation-reduction (Redox) reactions take place. Reduction takes place at the cathode. There, cobalt oxide combines with lithium ions to form lithium-cobalt oxide ( $\text{LiCoO}_2$ ). The half-reaction is:  $\text{CoO}_2 + \text{Li}^+ + e^- \rightarrow \text{LiCoO}_2$ . Oxidation takes place at the anode.

How many electrochemical cells are in a lithium ion battery?

While most household lithium-ion batteries consist of a single electrochemical cell generating a cell voltage of around 3.4 V, batteries providing higher voltages can be constructed from several such electrochemical cells in series.

What is a lithium ion battery?

Parts of a lithium-ion battery (© 2019 Let's Talk Science based on an image by ser\_igor via iStockphoto). Just like alkaline dry cell batteries, such as the ones used in clocks and TV remote controls, lithium-ion batteries provide power through the movement of ions. Lithium is extremely reactive in its elemental form.

What is the working voltage of a lithium ion battery?

High cell voltage A single cell of a LIB provides a working voltage of about 3.6 V, which is almost two to three times higher than that of a Ni-Cd, NiMH, and lead-acid battery cell. Good load characteristics The LIB provides steady voltage under any load condition.

This result makes sense: the equation matches the definition of the chemical potential of lithium in the cathode as the free-energy change when a mole of lithium is added to a large cathode, since adding lithium to the cathode converts  $\text{FePO}_4$  to  $\text{LiFePO}_4$ , which results in the free-energy change on the right-hand side of eqn (17).
