How does line loss affect solar power?

Understanding line loss is crucial when setting up your solar power system. When electricity flows through a wire, some of it gets lost along the way, impacting the efficiency of your solar system. This loss is influenced by the length and thickness of the wire, as well as the amount of current flowing through it.

Why do solar panels fail?

Blown bypass diodes - Permanent failure often due to severe localised shading or overheating. Earth leakage is a common problem with older solar panels that is often caused by backsheet failure leading to water ingress or PID or potential induced degradation. Strings of solar panels operate at high voltages, up to 600V or higher.

What happens if solar panels run at high voltages?

Strings of solar panels operate at high voltages, up to 600V or higher. Operating at these elevated voltages over many years can, in some cases, allow a current leak to develop through the cells to the aluminium frames of the solar panels and into the earth, resulting in a significant performance loss.

What causes a solar inverter to fail?

As highlighted in the photo,DC isolatorsmounted next to solar inverters are another common cause of failure, especially if the solar conduit enters the top of the isolator, allowing water to flow directly into the isolator if there is ever a broken seal or crack along the conduit connecting the rooftop solar array to the inverter.

How do I know if my solar inverter has a tripped circuit breaker?

A common solar inverter showing the AC and DC isolator switches mounted either side (as per Australian solar installation standards) Check that your switchboard has no tripped circuit breakers. All solar systems must have a Solar AC circuit breaker to protect the solar inverter and connecting cables from overcurrent or electrical faults.

What should I do if my solar inverter goes off?

If it trips back to the off position, leave it off and call an engineer. Also check your inverter for any fault codes or error messages. Check the real-time and cumulative generation on your inverter (most have these options) to make sure that the solar panels are still generating electricity.
