

How does a solar cell work?

A solar cell (SC) comprises multiple thin layers of semiconductor materials. When sunlight shines on an SC, photons excite electrons in the semiconductor materials, generating an electric current. In recent years, there have been rapid advancements in SC research, primarily focused on improving efficiency and reducing costs.

What is solar technology?

Solar technology refers to technology that uses solar radiation to generate electricity or utilize thermal energy. Solar energy is environmentally friendly, renewable, noiseless, and pollution-free and does not require fuel, making it a form of renewable energy. A solar cell (SC) comprises multiple thin layers of semiconductor materials.

What is a flexible solar cell?

The flexible solar cell with the structure of PET/ITO/ZnO thin film/ZnO nanorods/P3HT:PCBM/Ag exhibited a photovoltaic performance with an open circuit voltage (VOC) of 0.52 V, a short circuit current density (JSC) of 9.82 mA cm<sup>-2</sup>, a fill factor (FF) of 35% and a power conversion efficiency (?) of 1.78%.

What are the different types of flexible INP solar cells?

Two types of flexible InP solar cells were also fabricated and characterized, based on the stacked InP NM-ITO and InP NM-Al contacts, respectively. The efficiency of solar cells with ITO as back contact is five times higher than that with Al as back contact.
