How to select capacitors?

Aside from the capacitance, another thing to consider on how to select capacitors is the tolerance. If your application is very critical, then consider a very small tolerance. Capacitors come with several tolerance options like 5%, 10% and 20%. It is your call which is which.

Why is it important to choose the right capacitor?

Choosing the right capacitor is important in the present electronic world, as every device requires capacitors. The type of capacitor is also crucial, as it is available in different forms and with different ratings. Everything will be discussed in detail and all the points are kept in simple words which help easy to understand.

How to choose a film capacitor?

Thus, the first option is to consider an electrolytic capacitor. In some applications that the ripple current is very high, electrolytic capacitor will not work anymore as its ripple current is smaller. In this case, film capacitors are chosen as they are having very high ripple current rating.

Can a capacitor be installed in series?

Though there are few cases to install a capacitor in series. In my designs, I am not allowing to a voltage stress of more than 75%. This means, if the actual circuit voltage is 10V, the minimum capacitor voltage I will select is 13.33V ( $10V/0.75$ ). However, there is no such voltage. So, I will go to the next higher level that is 16V.

Which capacitor should be used for rectification?

For rectification, it requires most of the times a larger capacitance to get a near straight line voltage. Thus, the first option is to consider an electrolytic capacitor. In some applications that the ripple current is very high, electrolytic capacitor will not work anymore as its ripple current is smaller.

What is a good voltage rating for a capacitor?

The capacitor physical size is directly proportional to the voltage rating in most cases. For instance, in the sample circuit above, the maximum level of the voltage across the capacitor is the peak level of the 120Vrms that is around 170V ( $1.41 \times 120V$ ). So, the capacitor voltage rating should be 226.67V ( $170/0.75$ ).
